

iCepts Data Sync Framework

iCepts Data Sync Framework is a framework that is used by iCepts to enable us to drastically shorten development time for sharing data between applications. Each "Connector" is custom developed for each application, however the framework is already in place to allow shorter implementation and development time and therefore a lower cost.

The Framework includes the following features and benefits:

- User defined schedule so that you can tell each connector when it can and cannot operate.
- User defined operation interval.
- User Alerts for completion of operation for each connector.
- Logs and Log viewer to follow flow of operation.
- Auto archiving of logs
- Auto archiving of received data files for verification.
- User defined configuration for custom connectors.
- Included iCepts .NET Utilities and extensions.
- File checking to ensure correct data has been accepted.

iCepts Data Sync Framework gives you head start on application development for sharing data between applications. These applications can be either internal to your company or used to share information with external business partners.

Examples:

Company A uses a custom connector to bring in orders and order status from a 3rd party warehouse. Information is retrieved from the warehouse system and placed into an application where they can review the information all on one screen. From there the information is used to populate and update their accounting system. This eliminates the need to manually enter the information in each system.

Company B uses it to add their custom connector to bring in large orders from 6 different business partners all using different software. The information is then verified and placed into the ordering and fulfillment system for shipping. This eliminates the need for someone to manually enter orders into either system.
